Imagine that tomorrow, while cleaning out your gutters, you fall off a ladder. You suffer a traumatic brain injury and spinal cord damage, leaving you paralyzed, unable to speak, and with significantly impaired short- and long-term memory. Unable to work for the foreseeable future, you have no idea how you are going to support your family. Now imagine your relief when you realize an insurance policy you have been paying into all your working life will help keep you and your family afloat by replacing a portion of your lost wages. Fortunately, there is no need to conjure up the source of your relief: it is our Social Security system.

Overview

Social Security Disability Insurance has been a core pillar of our nation’s Social Security system for nearly six decades, offering critical protection when Americans need it most. Today, it protects more than 9 out of 10 American workers and their families in the event of a life-changing disability or illness that prevents substantial work. While it may not be easy to think about, a young worker starting a career today has a one-in-three chance of either dying or needing to turn to Disability Insurance before reaching his or her full Social Security retirement age of 67. In other words, Social Security Disability Insurance provides basic but essential protection.

While benefits are modest, averaging just $1,165 per month, Social Security Disability Insurance plays a significant role in boosting economic security for beneficiaries, and for 8 out of 10 beneficiaries it is their main or only source of income. According to the Organisation for Economic Co-operation and Development, or OECD, the program’s eligibility criteria are among the strictest in the world, and only individuals with the most significant disabilities and severe illnesses qualify. Fewer than 4 in 10 applicants are approved, even after all levels of appeal. Many beneficiaries have multiple impairments, and many are terminally ill: Nearly one in five die within five years of receiving benefits.
As expected, the program has grown in recent years, mostly due to well-understood demographic and labor-market changes: Baby Boomers aging into their high-disability years, the increase in women’s labor-force participation, and population growth. The growth of the program has leveled off and is projected to decline further in the coming years as Baby Boomers retire. While the Disability Insurance trust fund currently faces a financing shortfall, rebalancing the two Social Security trust funds will put the entire Social Security system on sound footing until 2033. Rebalancing has served as routine housekeeping to keep both trust funds on sound footing amid demographic shifts and has occurred repeatedly whenever needed in the program’s history, about equally in both directions. Several policy options exist to ensure the long-term solvency of the overall Social Security system thereafter. However, if Congress fails to act to prevent depletion of the Disability Insurance trust fund reserves, many beneficiaries will be needlessly pushed into or deeper into poverty.

Social Security Disability Insurance provides vital protection to nearly all American workers and their families

Social Security was established 80 years ago to ensure “the security of the men, women and children of the nation against the hazards and vicissitudes of life.” In 1956, the program was expanded to include Disability Insurance in recognition that the private market for long-term disability insurance was failing to provide adequate or affordable protection to workers.

Today, nearly all Americans—90 percent of workers ages 21 to 64—are protected by Social Security Disability Insurance. In all, more than 160 million American workers and their families are protected. About 8.9 million disabled workers—including more than 1 million veterans—receive Disability Insurance benefits, as well as about 146,000 spouses and 1.8 million dependent children of disabled workers.

Social Security Disability Insurance is coverage that workers earn

For a young worker with a spouse, two children, and average earnings, the value of the coverage that Disability Insurance provides is equivalent to a $580,000 insurance policy, and many estimates suggest that the real value of the protection it offers is much higher. Both workers and employers pay for Social Security through payroll tax contributions. Workers currently pay 6.2 percent of the first $118,500 of their earnings each year, and employers pay the same amount up to the same cap. Of that 6.2 percent, 5.3 percent currently goes to the Old Age and Survivors Insurance, or OASI, trust fund, and 0.9 percent to the Disability Insurance trust fund. Due to the interrelatedness of the Social Security programs, the two funds are typically considered together, although they are technically separate. The portion of payroll tax contributions that goes into each trust fund has changed several times throughout the years to account for demographic shifts and the funds’ respective projected solvency.
Benefits are modest but vital to economic security

The amount a qualifying worker receives in benefits is based on his or her prior earnings. Benefits are modest, typically replacing about half or less of a worker’s earnings. The average benefit is about $1,165 per month—not far above the federal poverty line.17

For more than 80 percent of beneficiaries, Disability Insurance is their main source of income. For one-third, it is their only source of income.18 Benefits are so modest that many beneficiaries struggle to make ends meet; nearly one in five, or about 1.6 million, disabled-worker beneficiaries live in poverty. But without Disability Insurance, this figure would more than double, and more than 4 million beneficiaries would be poor.19 And if Congress fails to act to prevent depletion of the Disability Insurance trust fund reserves, many beneficiaries will be pushed into or deeper into poverty due to an across-the-board benefit cut of nearly 20 percent.

Workers who receive Disability Insurance are also eligible for Medicare after a two-year waiting period.20

Social Security Disability Insurance provides protection most of us could never afford on the private market

Just one in three private-sector workers has employer-provided long-term disability insurance, and plans are often less adequate than Social Security.21 Coverage is especially scarce for low-wage workers—just 7 percent of workers making less than $12 an hour have employer-provided disability insurance.22 Workers in industries such as retail, hospitality, and construction are among the least likely to have employer-provided long-term disability coverage, and coverage is highly concentrated among white-collar professions.23 Access is even more limited on the individual market. While it is difficult to compare Social Security Disability Insurance with private long-term disability plans given that private plans often exclude certain types of impairments—as well as workers with pre-existing conditions or in high-risk occupations—purchasing a plan of comparable value and adequacy on the individual private market would be unrealistic for most Americans.

“Coverage by private [disability insurance] carriers is certain to be restricted, because disability insurance confronts all the major impediments to widespread, affordable, and actuarially sound private insurance provision: adverse selection, moral hazard, and covariance of risks. … Many insurers write group policies, but they differentiate strongly between groups with high and low risks. Some groups are treated as essentially uninsurable. Where risks are high, prices are high as well. The result is that private disability insurance tends to be available only to those groups who need it least; others are priced out of the market.”

Michael Graetz and Jerry Mashaw, noted social insurance experts and coauthors of True Security24

---

Average Social Security Disability Insurance benefit (April 2015):
$1,165 per month
$13,980 per year

Federal poverty line for an individual (2015):
$981 per month
$11,770 per year
Eligibility criteria are stringent and most applicants are denied

Social Security Disability Insurance is reserved for workers whose disabilities or illnesses are so debilitating that they cannot support themselves through work. Under the Social Security Act, the eligibility standard requires that a disabled worker be “unable to engage in substantial gainful activity”—defined as earning $1,090 per month, for 2015—“by reason of any medically determinable physical or mental impairment which can be expected to result in death or last for a continuous period of not less than 12 months.”\(^{25}\) In order to meet this rigorous standard, a worker must not only be unable to do his or her past jobs, but also—considering his or her age, education, and experience—any other job that exists in significant numbers in the national economy at a level where he or she could earn even $270 per week.\(^{26}\)

A worker must also have earned coverage in order to be protected by Disability Insurance. A worker must have worked at least one-fourth of his or her adult years, including at least 5 of the 10 years before the disability began in order to be “insured.”\(^{27}\) The typical disabled worker beneficiary worked 22 years before needing to turn to benefits.\(^{28}\)

---

**John** spent 40 years building houses. One day he collapsed on a job site, breaking multiple bones. After healing, he went back to work—until he collapsed again on the job. He was diagnosed with a debilitating heart condition that has left him unable to do even minor repairs on his own home. Social Security Disability Insurance has helped John keep his home out of foreclosure, put food on the table, and afford needed life-sustaining medications.

**Carol** worked for many years as a rare documents conservator at the Library of Congress until she was hit by a car while riding her bike to work. She suffered a severe traumatic brain injury that destroyed her short- and long-term memory, and left her unable to do even basic arithmetic with her first grade son. Social Security Disability Insurance helps Carol, her husband, and their young son afford their mortgage and monthly bills and access the care Carol needs to rebuild her life.

The National Organization of Social Security Claimants’ Representatives provided the Center for American Progress with these stories.\(^{29}\)

---

Comparing disability benefit systems, the OECD describes the United States—along with South Korea, Japan, and Canada—as having “the most stringent eligibility criteria for a full disability benefit, including the most rigid reference to all jobs available in the labor market.”\(^{30}\)

In practice, proving medical eligibility for Disability Insurance requires extensive medical evidence from one or more “acceptable medical sources”—licensed physicians, specialists, or other approved medical providers—documenting the applicant’s severe
impairment, or impairments, and resulting symptoms. Evidence from other providers, such as nurse practitioners or clinical social workers, is not enough to document a worker's medical condition. Statements from friends, loved ones, and the applicant are not considered medical evidence and are not sufficient to establish eligibility.

Fewer than 4 in 10 claims for Disability Insurance are approved under this stringent standard, even after all levels of appeal.31 Underscoring the strictness of the disability standard, thousands of applicants die each year while waiting for benefits.32 And one in five male and nearly one in six female beneficiaries die within five years of being approved for benefits.33 Disability Insurance beneficiaries have death rates three to six times higher than other people their age.34

**Beneficiaries have a wide range of significant disabilities and debilitating illnesses and many have multiple impairments**

Disabled workers who receive Disability Insurance live with a diverse range of severe impairments. The Social Security Administration categorizes beneficiaries according to their “primary diagnosis,” or main health condition.35 As of 2013, the most recent year for which impairment data are available:

- 31.5 percent have a “primary diagnosis” of a mental impairment, including 4.1 percent with intellectual disabilities and 27.4 percent with other types of mental disorders such as schizophrenia, post-traumatic stress disorder, or severe depression.
- 30.5 percent have a musculoskeletal or connective tissue disorder.
- 8.3 percent have a cardiovascular condition such as chronic heart failure.
- 9.3 percent have a disorder of the nervous system, such as cerebral palsy or multiple sclerosis, or a sensory impairment such as deafness or blindness.
- 20.4 percent include workers living with cancers; infectious diseases; injuries; genitourinary impairments such as end stage renal disease; congenital disorders; metabolic and endocrine diseases such as diabetes; diseases of the respiratory system; and diseases of other body systems.

A fact not well captured by Social Security’s data—given that beneficiaries are categorized by “primary diagnosis”—is that many beneficiaries have multiple serious health conditions. For instance, nearly half of individuals with mental disorders have more than one mental illness, such as major depressive disorder and a severe anxiety disorder.37 Individuals with mental illness are also at greater risk of poor physical health: The two leading causes of death for individuals with mental illness are cardiovascular disease and

---

**Social Security’s listing of impairments is organized according to 14 body systems**

- Musculoskeletal system
- Special senses and speech
- Respiratory system
- Cardiovascular system
- Digestive system
- Genitourinary disorders
- Hematological disorders
- Skin disorders
- Endocrine disorders
- Congenital disorders that affect multiple body systems
- Neurological
- Mental disorders
- Malignant neoplastic diseases
- Immune system disorders
Musculoskeletal disorders commonly afflict multiple joints, and individuals with musculoskeletal impairments—typically older workers whose bodies have broken down with age—commonly suffer additional health conditions such as cardiovascular disease, diabetes, and respiratory disease.

The breakdown of impairment categories among Disability Insurance beneficiaries is consistent with global health trends. According to the World Health Organization, the leading causes of disability today in most regions of the world—including the United States—are musculoskeletal impairments and mental disorders. The rise in mental impairments around the world is often attributed to increased awareness and reduced stigma of mental illness. And the global rise in musculoskeletal impairments is attributable to the aging of the population both in the United States and around the world—since the risk of experiencing musculoskeletal impairments rises sharply with age—as well as to the drop in mortality.

Most beneficiaries of Disability Insurance are older and had physically demanding occupations

Most beneficiaries of Disability Insurance—7 in 10—are in their 50s and 60s, and the average age is 53. The fact that most beneficiaries are older is unsurprising given that the likelihood of disability increases sharply with age: a worker is twice as likely to experience disability at age 50 than at 40, and twice as likely at 60 than at 50. Before turning to Social Security, most disabled-worker beneficiaries worked at “unskilled” or “semiskilled” physically demanding jobs. About half—53 percent—of disabled workers who receive Disability Insurance have a high school diploma or less. About one-third completed some college, and the remaining 18 percent completed four years of college or have further higher education.

Few beneficiaries are able to support themselves through work

Disability Insurance beneficiaries are permitted and encouraged to work. They may earn up to the substantial gainful activity level—$1,090 per month in 2014—with no effect on their monthly benefits. However, given how strict the Social Security disability standard is, most beneficiaries live with such debilitating impairments and health conditions that they are unable to work at all and most do not have earnings. According to a recent study linking Social Security data and earnings records before the onset of the Great Recession, in 2007, it was found that fewer than one in six, or 15 percent, of beneficiaries had earnings of even $1,000 during the year. The vast majority of those who worked earned very little, and just 3.9 percent earned more than $10,000 during the year—hardly enough to support oneself.

Further underscoring the strictness of the Social Security disability standard, even disabled workers who are denied benefits exhibit extremely low work capacity afterward. A recent study of workers denied Disability Insurance benefits found that just one in four were able to earn more than the substantial gainful activity level post-denial.

For those whose conditions improve and who wish to test their capacity to work, Social Security Administration policies include strong work incentives and supports. Beneficiaries whose conditions improve enough that they are able to earn more than the substantial gainful activity level are encouraged to work as much as they are able to and may earn an unlimited amount for up to 12 months without losing a dollar in benefits. Those who work above the substantial gainful activity level for more than 12 months enter a three-year “extended period of eligibility,” during which they receive a benefit only in the months in which they earn less the substantial gainful activity level. After the extended period of eligibility ends, if at any point in the next five years their condition worsens and they are not able to continue working above that level, they can return to benefits almost immediately through a process called “expedited reinstatement.” This process allows them to restart their needed benefits without having to repeat the entire, lengthy disability-determination process. These policies are extremely helpful to beneficiaries with episodic symptoms or whose conditions improve over time.
How does the United States compare with other countries?

- The Social Security disability standard is among the strictest in the world. The OECD describes the U.S. disability benefit system, along with those of Canada, Japan, and South Korea, as having “the most stringent eligibility criteria for a full disability benefit, including the most rigid reference to all jobs in the labor market.”

- Social Security Disability Insurance benefits are less generous than most other countries’ disability benefit programs. With Disability Insurance benefits replacing 42 percent of prior earnings for the median earner, the United States is ranked 30th out of 34 OECD member countries in terms of replacement rates. Many countries’ disability benefit programs replace 80 percent or more of prior earnings.

- By international standards, the United States spends comparatively little on disability benefits. In 2009, U.S. spending on Social Security Disability Insurance equaled 0.8 percent of gross domestic product, or GDP—again putting the United States near the bottom at 27th out of 34 OECD member countries in spending on equivalent programs. On average, OECD member countries spend 1.2 percent of GDP on their equivalent programs, and many—such as Denmark (2 percent), the United Kingdom (2.4 percent) and Norway (2.6 percent)—spend significantly more.

- The share of the U.S. working-age population receiving Disability Insurance benefits—about 6 percent—is roughly on par with the OECD average of 5.9 percent.

- In drawing international comparisons, it is well worth noting that in addition to more generous disability benefit systems with less rigorous eligibility standards, European nations tend to have universal paid leave policies, more generous health care systems, higher levels of social spending generally, and more regulated labor markets than the United States.

Growth is mostly due to demographic changes and is leveling off

As long projected by Social Security’s actuaries, the number of workers receiving Social Security Disability Insurance has increased over time, due mostly to demographic and labor-market shifts. According to recent analysis by Harvard economist Jeffrey Liebman, the growth in the program between 1977 and 2007 is due almost entirely—at 90 percent—to the Baby Boomers aging into the high-disability years of their 50s and 60s and the rise in women’s labor-force participation. Importantly, as Baby Boomers retire, the program’s growth has already leveled off and is projected to decline further in the coming years. Due to the importance of these demographic factors, Social Security’s
actuaries analyze trends in benefit receipt using the “age-sex adjusted disability prevalence rate,” which controls for changes in the age and sex distribution of the insured population, as well as population growth. The age-sex adjusted disability prevalence rate was 4.6 percent in 2014 compared to 3.1 percent in 1980.60

Key drivers of the program’s growth include:

**Aging population:** The risk of disability increases sharply with age. A worker is twice as likely to be disabled at age 50 than at 40, and again twice as likely at age 60 than at 50.61 Born between 1946 and 1964, Baby Boomers have now aged into their high-disability years, driving much of the growth in Disability Insurance.

**Increase in women’s labor-force participation:** Whereas previous generations of women had not worked enough to be insured in case of disability, women today have essentially caught up with men when it comes to being insured for benefits based on their work history.62

**Population growth:** The working-age population—ages 20 to 64—has grown significantly, by 43 percent between 1980 and 2014.63 The Center on Budget and Policy Priorities estimates that population growth alone—even if the population were not aging—would have resulted in an additional 1.25 million beneficiaries during that time period.64

**Women’s catch-up in rates of receipt:** Just as women have caught up with men in terms of having worked enough to be insured for Disability Insurance, the gender gap in rates of receipt of benefits has closed as well. As recently as 1990, male workers outnumbered female workers by 2-to-1, whereas today, nearly 48 percent of workers receiving Disability Insurance are women.65 (see Figure 2)

![FIGURE 2](image_url)

**Women have caught up to men in insured status**

Number of male and female workers insured in case of disability, in thousands, 1970–2014

Increase in Social Security retirement age: The increase in the Social Security retirement age from 65 to 67 has played a role as well, as disabled workers continue receiving Social Security Disability Insurance for longer before converting to retirement benefits when they reach full retirement age. About 5 percent of Social Security Disability Insurance beneficiaries are ages 65 and 66.66

The Great Recession in context

Social Security’s actuaries note that the main effect of the recent economic downturn was lower revenue through payroll tax contributions—not an increase in beneficiaries.67 While recessions are typically associated with sharp increases in applications for Social Security Disability Insurance, they have a much smaller impact on awards. The most recent downturn was no exception, and Social Security’s actuaries estimate that just 5 percent of the program’s growth from 1980 to 2010 is due to the recession,68 likely due to workers with disabilities being disproportionately laid off from employer payrolls when times got tight. It is important to note that while applications increased during the Great Recession, the award rate—the share of applications approved for benefits—declined,69 indicating that applicants who did not meet the rigid disability standard were screened out. (see Figure 3) A study by Social Security’s watchdog examined the 11 states with the highest unemployment rates and found that award rates had dropped in all of them.70 Moreover, a recent National Bureau of Economic Research study found “no indication that expiration of unemployment insurance benefits causes Social Security Disability Insurance applications.”71 A recent White House Council of Economic Advisers report examining labor-force participation trends since 2007 found that the increase in the number of disabled workers receiving Disability Insurance has had a minimal effect on labor-force participation, noting “in fact, if anything, the increase in disability rolls since 2009 have been somewhat lower than one would have predicted given the predicted cyclical and demographic effects.”72

FIGURE 3

Routine action is needed to address finances

As the Baby Boom generation retires, the growth in Disability Insurance has already leveled off and is protected to decline further. Social Security’s actuaries have projected since the mid-1990s that the Disability Insurance trust fund would be able to pay all scheduled benefits until 2016, at which point action would be needed to shore up the fund. Absent needed action, the Disability Insurance trust fund will be able to pay 80 percent of promised benefits after 2016.

While the OASI fund and the Disability Insurance fund are technically separate, they are typically considered together due to the interrelatedness of Social Security’s programs. For example, Social Security’s programs share the same benefit formula, beneficiaries regularly move between programs, and changes to one program—such as raising the retirement age—affect both trust funds. Since Social Security Disability Insurance was established in 1956, Congress has repeatedly, on a bipartisan basis, rebalanced the OASI and Disability Insurance trust funds to keep both on sound footing amid changing demographics. Rebalancing—by reallocating the share of payroll tax contributions that go into each fund—has occurred repeatedly over the years whenever needed, roughly equally in both directions.

Congress has never allowed a drop in scheduled benefits to occur. As President Obama called for in his administration’s FY 2016 budget, Congress could again enact a modest, temporary reallocation of the 6.2 percent payroll tax rate between OASI and Disability Insurance to equalize the solvency of the two funds. The reallocation plan outlined by Social Security’s chief actuary would ensure that both funds remain fully solvent until 2033. Reallocation would have essentially no impact on the financial health of the overall Social Security system. Under current law, as well as under reallocation, the combined trust funds will be able to pay all scheduled benefits until 2033, after which they will be able to pay about 77 percent of promised benefits.

While the combined trust funds are set to remain on sound footing for the next nearly two decades, action will be needed sometime during that time period to ensure the long-term solvency of the overall Social Security system. But in the near term, as Secretary of the Treasury Jacob Lew noted in testimony before the Senate Budget Committee, “There is only one solution the technical experts believe can work in the timeframe between now and 2016. And that’s a reallocation of the tax rate, as we’ve done in the past.”

Looking past 2016, there are a number of options for ensuring the long-term solvency of the overall Social Security system without cutting already modest benefits—something that polls consistently confirm most Americans oppose. Frequently discussed policy options include modestly increasing the 6.2 percent payroll tax rate that workers and employers each pay and eliminating the cap on earnings that are subject to payroll taxes so that the 5 percent of workers who earn more than the cap would pay into the system all year as other workers do. A recent survey conducted by the nonpartisan National Academy of Social Insurance found overwhelming support for a reform package that includes both of these options while also boosting benefits. An array of legislation introduced within the past few years has included variations of these reforms, reflecting their growing popularity.

Adequate administrative funding is needed to address backlogs and ensure program integrity

SSA’s administrative costs are less than 1.3 percent of the benefits it pays out each year. The agency requires sufficient administrative funding not only to process applications for and payment of benefits, but also to perform important program integrity work, such as pre-effectuation reviews of disability determinations and continuing disability reviews to ensure benefits are paid only as long as the individual remains eligible.

In recent years, the agency’s administrative budget has been significantly underfunded. Congress appropriated more than $1 billion less for SSA’s Limitation on Administrative Expenses, or LAE, than President Obama’s request between FY 2011 and FY 2013. Additionally, in FY 2012 and 2013 Congress appropriated nearly $500 million less for the agency’s program integrity activities—such as continuing disability reviews—than the Budget Control Act of 2011 authorized. As a result, during a time of increasing workload due to the Baby Boomers entering retirement and their disability-prone years, the agency lost more than 11,000 employees—a 13 percent drop in its workforce—hampering the agency’s ability to serve the public and keep up with vital program integrity activities. In a positive step, the FY 2014 budget bill provided the agency with full funding at the FY 2014 Budget Control Act levels for program integrity activities.
But in FY 2015, SSA received $218 million less for LAE than the president’s request. President Obama’s FY 2015 budget request would have allowed SSA to complete 98,000 more continuing disability reviews during this fiscal year.

Adequate resources are needed to support claims processing and disability determinations at the initial levels so that the right decision can be made at the earliest point in the process and needless appeals can be avoided. Additionally, adequate resources are urgently needed to address the tremendous backlogs that have emerged at the ALJ hearing level. The average wait time for an ALJ hearing is well over one year—closer to two years in many hearing offices—and more than 1 million applicants are currently waiting for a hearing.

Additionally, the agency requires sufficient administrative funding to conduct important program integrity activities such as continuing disability reviews to ensure benefits are paid only as long as the individual remains eligible. Continuing disability reviews are estimated to save some $9 in benefits for every $1 spent on reviews, yet the agency reports a backlog of nearly 1.3 million reviews due to inadequate funding. As policymakers consider options to ensure Social Security’s solvency, providing the agency with adequate administrative funding to administer its programs and ensure program integrity—as the Social Security Fraud and Error Prevention Act would do—should be a common-sense, bipartisan step.

Conclusion

Social Security Disability Insurance has been a core pillar of our nation’s Social Security system for close to six decades, offering critical protection to nearly all American workers and their families in the event of a life-changing disability or illness. It is a lifeline to millions of Americans, providing critical economic security when it is needed most. Congress has many options to ensure long-term solvency of the overall Social Security system over the next two decades. In the meantime, rebalancing the OASI and Disability Insurance trust funds—as has been done repeatedly, whenever needed in the program’s history—would ensure that Social Security is able to pay all promised retirement, disability, and survivor benefits for the next nearly two decades.

Authors’ note

This report reflects the current views of the Center for American Progress on policy related to Social Security Disability Insurance. The stance in this report differs from an earlier paper—“Supporting Work: A Proposal for Modernizing the U.S. Disability Insurance System,” by David Autor and Mark Duggan (2010)—which was part of a series jointly sponsored by the Center for American Progress and the Hamilton Project at the Brookings Institution. That paper was a cobranded paper and was not the work of CAP’s policy staff. It cited growth in the Disability Insurance population relative to the working-age population as a source of concern because of the impact on the overall Social Security budget. As discussed herein, subsequent analysis conducted by the Social Security Administration’s Office of the Chief Actuary and others shows that growth in recipiency rates is unlikely in the years ahead and that there may in fact be declines. The views expressed in this report reflect the weight CAP gives to this stabilization and to other recent data.

As discussed elsewhere in this report, Social Security’s actuarial tools use the age-sex adjusted prevalence rate to analyze trends in benefit receipt. OECD data use percent of working-age population, so that is the figure used here. Organisation for Economic Co-operation and Development, “Sickness, Disability, and Work: Breaking the Barriers: A Synthesis of Findings across OECD Countries.”

58 Liebman also finds that most of the program’s more recent growth, from 1993 to 2007—over 70 percent—is due to these two factors. By comparison, using 1985 as the base year, these two factors explain 45 percent of the program’s growth, as the DI recipiency rate was abnormally low in the wake of program retrenchment carried out by the Reagan administration; this retrenchment resulted in hundreds of thousands of beneficiaries losing benefits unjustly. Subsequent reforms in response to the widespread terminations gradually restored recipiency rates to typical levels. Worth noting, Liebman looked at the DI recipiency rate—not the number of beneficiaries—so population growth did not affect his modeling. Jeffrey Liebman, “Understanding the Increase in Disability Insurance Benefit Receipt in the United States,” Journal of Economic Perspectives, 29 (2) (2015). Analysis by Social Security Administration researchers has yielded similar conclusions. David Pattison and Hilary Waldron, “Growth in New Disabled Worker Entitlements, 1970-2008,” Social Security Bulletin 73 (4) (2013): 25–48, available at http://www.ssa.gov/policy/docs/sb/v73n4/v73n4p25.pdf (finding that 90 percent of the program’s growth between 1970 and 2008 is due to aging Baby Boomers, increased women’s labor-force participation, and population growth.

75 A common example of movement between programs is that Disability Insurance beneficiaries convert to Social Security retirement benefits when they reach the Social Security retirement age.

79 U.S. Secretary of the Treasury Jacob Lew testified at a March 2014 budget hearing that “there’s only one solution the technical experts believe can work in the timeframe between now and 2016. And that’s a reallocation of the tax rate, as we’ve done in the past.” Jacob Lew, Testimony before the U.S. Senate Budget Committee, March 6, 2014. Video of Secretary Lew’s testimony available at http://www.bloomberg.com/video/lew-testifies-before-senate-on-obama-budget-plan-20140612.html.
